

## DBMS -> DataBase Management System

DBMS --> System that manages different DataBases

DataBase (DB's) --> Collection of inter-related data -->

Data --> information of a particular object

students				
id	name	age		
1	E	25		
2	N	25		

manages db --> create some data, update some data,  
delete data, add data

CURD --> create, update, Read, Delete

SQL --> used to query the data in database

Sender

Reciever

100000

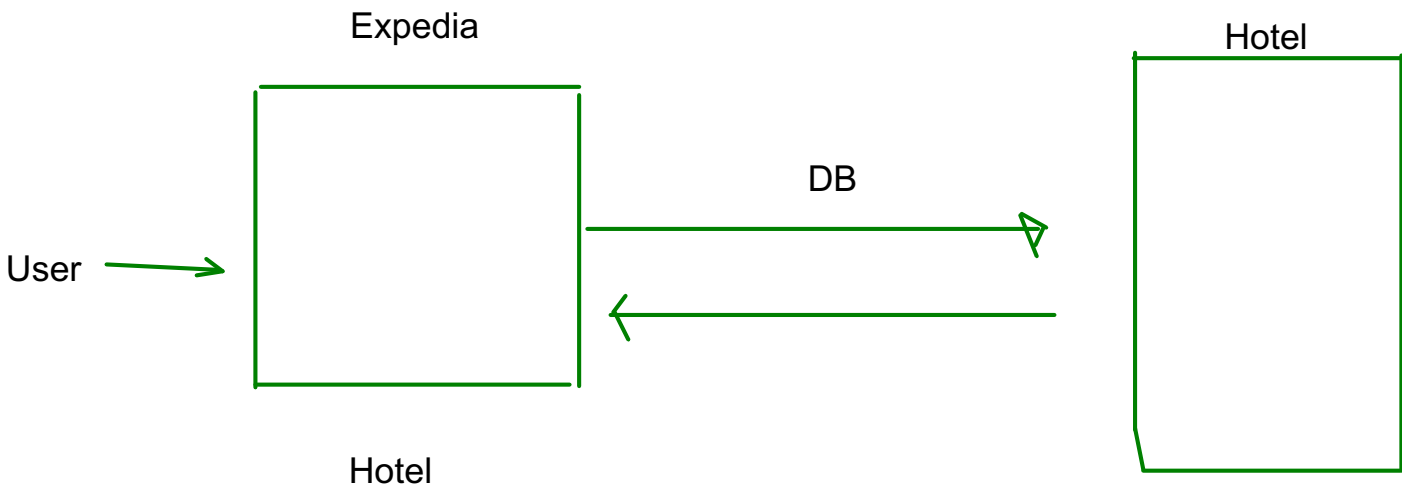

200000

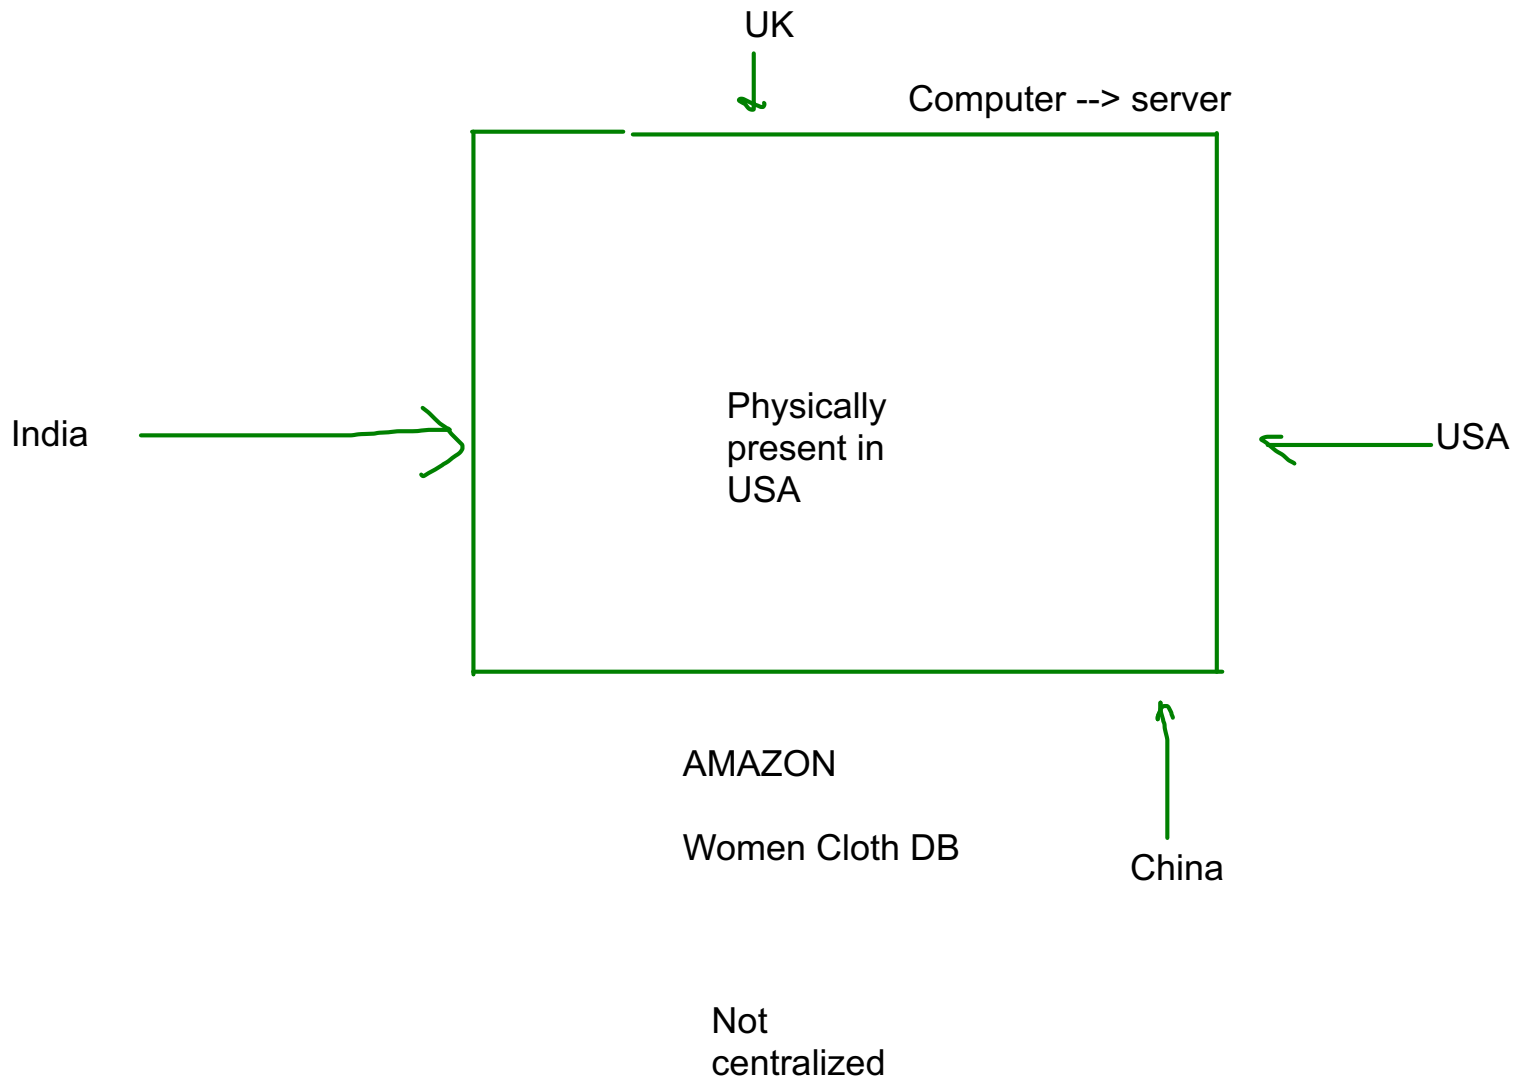

1000 RS

99000

201000

Relational DB --> RDMS (system manages relational DB)

SQL --> query Relation DB

ACID property

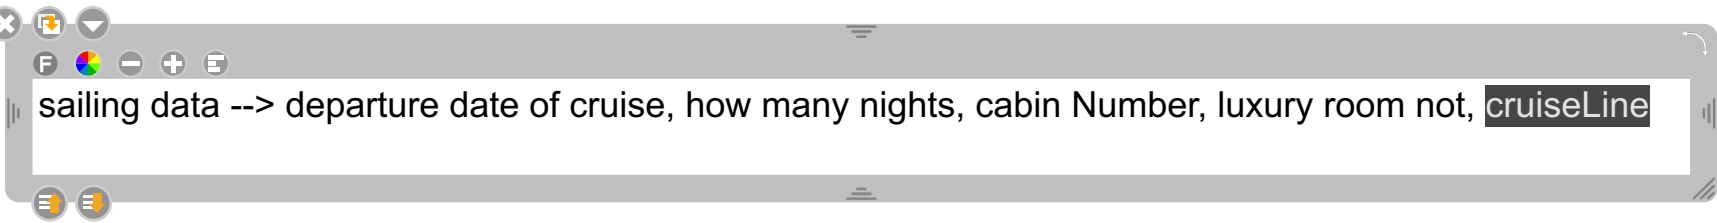

students				
id		age		
1	E	25		
2	N	25		

Student --> entity

row --> tuple

column --> attribute

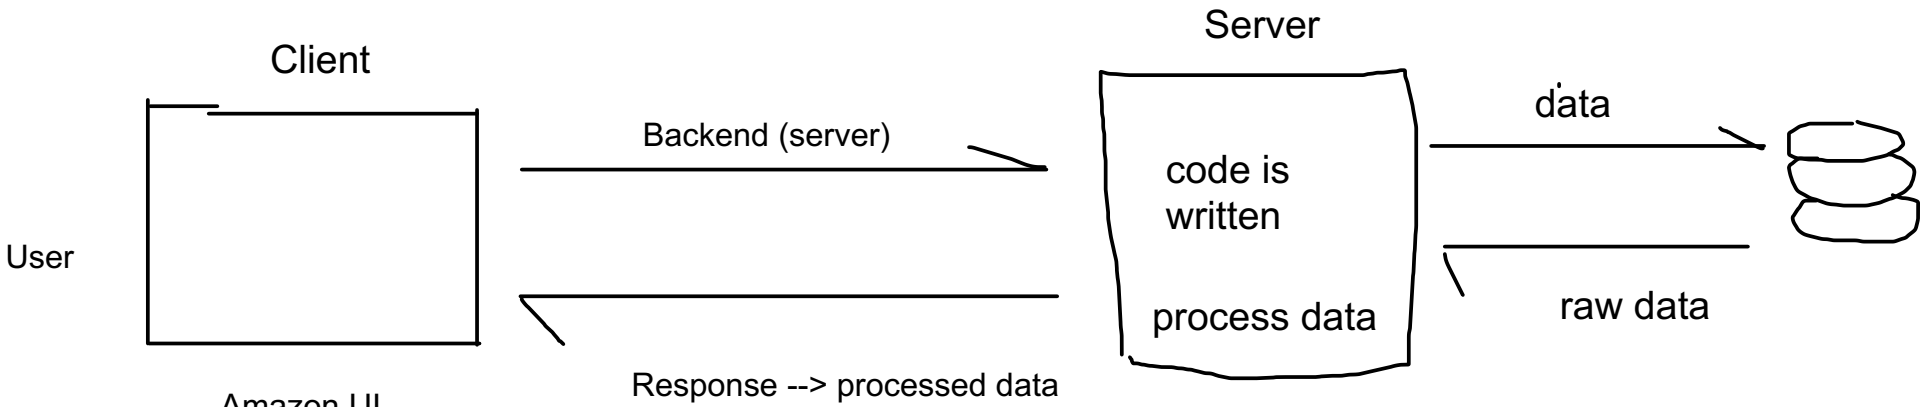

NO SQL

# Web Application

Amazon UI
